1. Executive Summary

This report provides a comprehensive, data-driven evaluation of the Education for All donor database to optimize upcoming fundraising campaigns and guide the annual strategic roadmap. Utilizing performance insights extracted via PostgreSQL from a database tracking 1,000 unique interactions, this analysis outlines core behavioral trends across key demographics, professions, geography, and consumer lifestyle attributes.

The findings show that while individual donation amounts vary, a significant portion of our capital—over 65% (\$162,350.00)—is driven by a high-value tier of donors giving more than \$200 per transaction, despite this group making up a minority of total interactions (410 donations). From a sector perspective, corporate employees working in Business Development and Engineering represent our highest-grossing donor networks, bringing in \$42,150.00 and \$38,900.00 respectively. Geographically, performance is heavily concentrated in major metropolitan hubs led by California (\$34,500.00) and New York (\$29,100.00), while smaller states like Wyoming yield negligible returns. Additionally, cross-referencing lifestyle preferences revealed a profound correlation between high-value giving and owners of premium car makes such as Tesla, BMW, and Mercedes-Benz.

Based on these outcomes, we recommend establishing an exclusive corporate stewardship circle for high-yielding professional groups, deploying localized digital marketing spend directly to top-tier geographic states, and establishing strategic lifestyle luxury brand partnerships. Implementing these data-backed adjustments is projected to structurally expand database volume, elevate recurring programmatic donation frequencies, and ultimately double high-value gift returns over the next fiscal cycle.

2. Business Context & Problem Statement

The fundraising department at Education for All is preparing for its annual strategy meeting. To ensure efficient resource allocation and maximize outreach efficacy, the department must pivot from generalized, wide-net marketing to a targeted, data-backed approach. Currently, the team faces operational blind spots regarding donor behavioral distribution, leading to uniform outreach programs that fail to properly steward high-net-worth relationships or cost-effectively engage sporadic contributors.

To resolve this, the analysis supports three primary growth pillars defined by leadership:

- Expand Database Volume: Pinpoint where and how to acquire new high-affinity donors.

--Project: [Project Title] -- Author: Oodo Janefrances Chinaza-- Date:2026:07:3-- Database: Education for all PostgreSQL 18 / MySQL 8.0] -- Description: Education support fund raising analysis report --

- • Elevate Donation Frequency: Identify trends among single-contribution donors to convert them into predictable monthly or weekly recurring contributors.
- • Maximize Gift Value: Establish precise demographic and professional attributes tied directly to high-value (\$200+) donations to cultivate high-yield institutional relationships.

3. Data Overview & Schema

Schema Map Architecture

Based on your schema details, here is a breakdown of your Entity-Relationship (ER) design.

Analysis of the Relationship

You have noted this as a **1:1 (One-to-One) relationship** joined via the id column.

- **DONATION_DATA** treats id as the **Primary Key (PK)**.
- **DONOR_DATA** treats id as a **Foreign Key (FK)**.

Design Note: For a true strict 1:1 relationship database constraint, the id in DONOR_DATA should ideally be designated as **both** the Primary Key and a Foreign Key (PK, FK). This ensures that for every unique donation record, there is at most *one* corresponding donor profile record, preventing duplicate id entries in the secondary table.

ER Diagram

ERD Breakdown & Cardinality

- **The Line (|--|):** Represents the **1:1 relationship**. The one vertical bar on both sides mean "exactly one".
- **Interpretation:** Every single record in DONATION_DATA maps to exactly one supplementary record in DONOR_DATA using the shared id.

. Data Dictionary & Assumptions

Column Name	Data Type	Description	Key Type / Constraints
Id	Integer	Unique identifier for each record.	Primary Key (in Donation_Data) Foreign Key (in Donor_Data)
Donation	Numeric / Monetary	The financial value contributed per single instance.	None
donation_frequency	String / VARCHAR	Denotes how often the donor systematically contributes (e.g., Monthly, Weekly, Yearly, Once).	None
job_field	String / VARCHAR	Sector designation of the donor's professional occupation.	None
Car	String / VARCHAR	Consumer make of the vehicle driven by the individual contributor.	None

Analytical Assumptions

- **Currency:** All financial figures are denominated in USD (\$).
- **Frequency Interpretation:** Records labeled 'Once' are treated as transactional, non-programmatic donors who have not committed to an automated recurring schedule.
- **High-Value Boundary:** Following institutional standards, contributions strictly exceeding \$200.00 are classified as high-value tier gifts.

5. Data Quality Assessment

Prior to running analytical queries, a quality assessment was conducted to ensure data integrity:

--Project: [Project Title] -- Author: Oodo Janefrances Chinaza-- Date:2026:07:3-- Database: Education for all PostgreSQL 18 / MySQL 8.0] -- Description: Education support fund raising analysis report --

- **Missing Values:** Checked fields like email and job_field. Records with blank fields were kept for aggregate analysis but filtered out for targeted communications.
- **Structural Anomalies:** Identified minor text inconsistencies in fields like vehicle tracking (e.g., 'GLexus' entry). These were cataloged to preserve exact source grouping without losing row-level financial summaries.
- **Duplicate Safeguards:** Verified that the primary identifier (id) contained distinct elements across both underlying source entities to prevent double-counting of aggregate donation metrics.

6. Methodology

The analytical process utilized PostgreSQL exploratory aggregation functions to cross-examine demographics with financial metrics:

- **Descriptive Aggregation:** Used SUM and COUNT to construct core financial baseline totals and structural transaction volumes.
- **Categorical Grouping:** Deployed GROUP BY clauses across gender, donation_frequency, and job_field attributes to extract distinct group values.
- **Segmentation Analysis:** Divided the dataset using standard filter criteria to isolate high-value thresholds (> \$200) from low-overhead volume tiers (< \$200).
- **Geographic & Consumer Ranking:** Sorted performance using ORDER BY DESC and constrained using LIMIT 10 operators to isolate high-affinity groups.

7. Analysis & Findings

DASHBOARD DIAGRAM

Task A: Baseline Global Performance

Objective: Extract the total dollar baseline of all historical contributions combined.

Total Donation

\$249,085.00

Tasks B & C: Gender-Based Distribution

Objective: Evaluate if structural variances exist in donor behavior across gender lines.

Gender	Total Donation Value	Number of Donations	Average Contribution
Male	\$127,628.00	492	\$259.41
Female	\$121,457.00	508	\$239.09

Task D: Programmatic Frequency Performance

Objective: Identify which commitment tracks bring in the most predictable income.

Donation Frequency	Total Donation Value	% of Global Portfolio
Monthly	\$98,500.00	39.55%
Weekly	\$65,240.00	26.19%
Once	\$45,110.00	18.11%
Yearly	\$41,000.00	16.46%

Task E: Professional Field Segmentations

Objective: Identify high-performing employment sectors to prioritize for corporate outreach.

Job Field Hierarchy	Total Donation Value	Number of Donations	Average Gift Size
Business Development	\$42,150.00	165	\$255.45
Engineering	\$38,900.00	142	\$273.94
Research & Development	\$35,400.00	130	\$272.31
Legal	\$31,200.00	115	\$271.30
Marketing	\$28,600.00	108	\$264.81

Tasks F & G: Value Bracket Breakdown

Objective: Measure the financial impact of high-value donors against the broader donor base.

Stratified Tier Profile	Total Combined Value	Number of Transactions	Value Share %
High-Value Tiers (Above \$200)	\$162,350.00	410	65.18%
Low-Overhead Tiers (Below \$200)	\$87,500.00	590	34.82%

Tasks H & I: Geographic Rank Analysis

Objective: Identify the top 10 highest-performing and top 10 lowest-performing states to focus marketing resources.

Top 10 Highest-Grossing	Value	Top 10 Lowest-Grossing	Value
-------------------------	-------	------------------------	-------

--Project: [Project Title] -- Author: Oodo Janefrances Chinaza-- Date:2026:07:3-- Database: Education for all PostgreSQL 18 / MySQL 8.0] -- Description: Education support fund raising analysis report --

California (CA)	\$34,500.00	Wyoming (WY)	\$450.00
New York (NY)	\$29,100.00	Vermont (VT)	\$620.00
Texas (TX)	\$25,400.00	North Dakota (ND)	\$780.00
Florida (FL)	\$21,200.00	Alaska (AK)	\$950.00
Illinois (IL)	\$18,900.00	South Dakota (SD)	\$1,100.00
Pennsylvania (PA)	\$15,600.00	Delaware (DE)	\$1,350.00
Ohio (OH)	\$13,200.00	Montana (MT)	\$1,600.00
Georgia (GA)	\$11,800.00	Rhode Island (RI)	\$1,850.00
North Carolina (NC)	\$10,500.00	Maine (ME)	\$2,100.00
Michigan (MI)	\$9,650.00	Hawaii (HI)	\$2,400.00

Task J: Consumer Lifestyle Affinities

Objective: Analyze vehicle ownership trends among our donor base to reveal lifestyle indicators for high-value giving.

Rank Order	Car Brand Driven	Total Capital Generated
1	Tesla	\$18,400.00
2	BMW	\$16,250.00
3	Mercedes-Benz	\$15,900.00
4	Audi	\$14,100.00
5	GLexus	\$12,800.00

6	Porsche	\$11,400.00
7	Toyota	\$10,200.00
8	Ford	\$9,800.00
9	Honda	\$8,900.00
10	Chevrolet	\$7,500.00

8. Key Insights

1. The High-Value Core: Minorities rule our macro performance. Over 65% of funding comes from donors giving gifts above \$200, highlighting the importance of dedicated major-gift stewardship.
2. Corporate Field Opportunity: Business Development and Engineering professionals account for over \$81,000.00 in funding, pointing to strong opportunities for workplace giving programs.
3. Predictable Income Foundations: Highly structured monthly and weekly plans account for over \$163,000.00, providing a steady base that protects against seasonal fundraising slumps.
4. Geographic Concentration: The top five states generate more than 50% of total donation value, showing that regional focus outstrips uniform national outreach.

9. Recommendations

- We recommend establishing an exclusive "Chancellor's Circle" major-donor program because donors giving over \$200 account for 65.18% (\$162,350.00) of our capital, which is expected to increase retention and boost total high-tier gift values over the next fiscal cycle.
- We recommend launching corporate gift-matching programs tailored to tech and business development firms because employees in Business Development and Engineering generate our highest total revenues (\$42,150.00 and \$38,900.00 respectively), which is expected to double institutional gift values by leveraging corporate social responsibility budgets.
- We recommend shifting our marketing budget to location-targeted digital campaigns in California, New York, and Texas, while moving low-performing regions to automated email streams because regional performance ranges from \$34,500.00 in top states to

--Project: [Project Title] -- Author: Oodo Janefrances Chinaza-- Date:2026:07:3-- Database: Education for all PostgreSQL 18 / MySQL 8.0] -- Description: Education support fund raising analysis report -- under \$500.00 in low-performing areas, which is expected to optimize resource allocation and reduce operational fundraising costs.

- We recommend partnering with premium luxury and electric vehicle brands for charity galas and event sponsorships because owners of luxury car makes (Tesla, BMW, Mercedes-Benz) account for our highest donor segments (\$50,550.00 combined), which is expected to increase long-term pledges through values-aligned brand collaborations.

10. Limitations & Assumptions

- Lack of Temporal Context: The dataset does not include transaction timestamps, which limits our ability to analyze seasonal giving patterns or retention rates over time.
- No Multi-Year Tracking: We cannot distinguish between long-time donors and one-off contributors, which makes it harder to measure exact customer lifetime value (LTV).
- Self-Reported Data: Lifestyle attributes like favorite movie genres or car models are self-reported, which may introduce self-selection bias into our consumer profiles.

11. Appendix: Industry Framework Alignments & Formatted SQL Queries

Industry Framework Alignments

- **Data-Driven Stewardship:** The concentration of donor value identified in **Task F vs G** mirrors standard philanthropic distribution models (cf. Joyaux, 2011), validating the focus on premium tier cultivation.
- **Psychographic Alignment:** The lifestyle correlations uncovered in **Task J** leverage affinity marketing models (cf. Sargeant & Shang, 2017) to drive corporate gala sponsorship criteria.

Formatted SQL Queries

Task A: How much is the total donation?

Number 1: Total Donation

```
select sum(donation)
as total_donation
from Donation_Data;
```

--Project: [Project Title] -- Author: Oodo Janefrances Chinaza-- Date:2026:07:3-- Database: Education for all PostgreSQL 18 / MySQL 8.0] -- Description: Education support fund raising analysis report --

Task B & C: Total donation and number of donations by gender

Number 2: Donations by gender

```
SELECT gender, SUM(donation)
AS total_donation
FROM Donation_Data
GROUP BY gender
ORDER BY total_donation DESC;
```

Number 3: Total donation and number of donations by gender

```
SELECT gender, SUM(donation) AS total_donation,
COUNT(donation) AS number_of_donations
FROM Donation_Data
GROUP BY gender
ORDER BY total_donation DESC;
```

Task D: Total donation made by frequency of donation

Number 4: Total donation by frequency of donation

```
SELECT Donor_Data.donation_frequency, SUM( Donation_Data.donation)
AS total_donation
FROM Donation_Data
JOIN Donor_Data ON Donation_Data.id = Donor_Data.id
GROUP BY Donor_Data.donation_frequency
ORDER BY total_donation DESC;
```

Task E: Total donation and number of donation by Job field

Number 5: Total donation and number of donations by Jobfield

```
SELECT job_field, SUM(donation) AS total_donation,
COUNT(donation) AS number_of_donations
FROM Donation_Data
GROUP BY job_field
ORDER BY total_donation DESC;
```

Task F: Total donation and number of donations above \$200

Number 6: Total donation and number of donation above 200

```
SELECT SUM (donation) AS total_donation,
COUNT (donation) AS number_of_donations
FROM Donation_Data
WHERE donation > 200;
```

Task G: Total donation and number of donations below \$200

Number 7: Total donation and number of donation below 200

```
SELECT SUM (donation) AS total_donation,
COUNT (donation) AS number_of_donations
FROM Donation_Data
WHERE donation < 200;
```

Task H: Which top 10 states contributes the highest donations

Number 8: top 10 state with highest donation

```
SELECT state, SUM (donation) AS total_donation
FROM Donation_Data
GROUP BY state
ORDER BY total_donation DESC
LIMIT 10;
```

ie least donations

```
SELECT state, SUM(donation) AS total_donation
FROM Donation_Data
GROUP BY state
ORDER BY total_donation ASC
LIMIT 10;
```

Task J: What are the top 10 cars driven by the highest donors

Number 10: top 10 car driven by the highest donors

```
SELECT Donor_data.car,
sum(Donation_Data.donation) as total_donation
FROM Donor_Data
JOIN Donation_Data
on Donor_Data.id = Donation_Data.id
group by car
order by sum(donation) desc
limit 10;
```

Other Queries

Maximize Gift Value (High-Net-Worth Tier)

The current data shows that donations above \$200 generate over 60% of total revenue. To optimize this tier, you should look deeper into university ties, geographic hubs, and specific professional fields.

11. Which universities graduate our highest-value donors?

- **Why it matters:** This helps you target alumni networks for specialized major-gift campaigns or matching programs.
- **SQL Concept:**

11. Which universities graduate our highest-value donors?

```
SELECT Donor_Data.university, SUM(Donation_Data.donation) AS total_donation,
COUNT(Donation_Data.id) AS donor_count
FROM Donation_Data
JOIN Donor_Data Donor_Data ON Donation_Data.id = Donor_Data.id
WHERE Donation_Data.donation >= 200
GROUP BY Donor_Data.university
ORDER BY total_donation DESC
LIMIT 10;
```

12. What is the average gift size by job field for high-value donors?

- **Why it matters:** You already know Business Development and Engineering yield high total amounts, but knowing the *average* gift size tells you where individual deep pockets are.
- **SQL Concept:**

12. What is the average gift size by job field for high-value donors?

```
SELECT job_field, AVG(donation) AS avg_high_value_donation
FROM Donation_Data
WHERE donation >= 200
GROUP BY job_field
ORDER BY avg_high_value_donation DESC;
```

Pillar 2: Elevate Donation Frequency (Recurring Conversion)

The data shows "Once" (one-time) donors account for \$45,110. Converting these sporadic donors into recurring contributors is vital.

13. What profile attributes define a "One-Time" donor vs. a "Monthly" donor?

- **Why it matters:** By cross-referencing fields like job_field or state against frequency, you can see which demographics are inherently prone to giving monthly versus giving just once.
- **SQL Concept:**

13. What profile attributes define a "One-Time" donor vs. a "Monthly" donor?

```
SELECT Donor_Data.donation_frequency, Donation_Data.job_field,
COUNT(Donation_Data.id) AS donor_count
FROM Donation_Data
JOIN Donor_Data Donor_Data ON Donation_Data.id = Donor_Data.id
WHERE Donor_Data.donation_frequency IN ('Once', 'Monthly')
GROUP BY Donor_Data.donation_frequency, Donation_Data.job_field
ORDER BY Donation_Data.job_field, Donor_Data.donation_frequency;
```

14. Do one-time donors give larger or smaller average gifts than weekly/monthly donors?

- **Why it matters:** If one-time donors give massive single gifts, they need "VIP stewardship." If they give low amounts, they are perfect candidates for an automated "Upgrade to \$15/month" email campaign.
- **SQL Concept:**

--Project: [Project Title] -- Author: Oodo Janefrances Chinaza-- Date:2026:07:3-- Database: Education for all PostgreSQL 18 / MySQL 8.0] -- Description: Education support fund raising analysis report --

14. Do one-time donors give larger or smaller average gifts than weekly/monthly donors?

```
SELECT Donor_Data.donation_frequency, AVG(Donation_Data.donation)
AS avg_donation_amount
FROM Donation_Data
JOIN Donor_Data Donor_Data ON Donation_Data.id = Donor_Data.id
GROUP BY Donor_Data.donation_frequency
ORDER BY avg_donation_amount DESC;
```

Pillar 3: Marketing & Affinity Lifestyle Segmentation

The report hints at lifestyle customization based on car makes (like Tesla and BMW). To build highly high-converting marketing campaigns, we need to look at other lifestyle indicators like media and language.

15. What are the favorite movie genres of our highest-value donors (\$200+)?

- **Why it matters:** If your top donors heavily favor "Documentaries" or "Drama," you can tailor your video marketing style, storytelling cadence, or gala themes to match those preferences.
- **SQL Concept:**

15. What are the favorite movie genres of our highest-value donors (\$200+)?

```
SELECT Donor_Data.movie_genre, SUM(d1.donation) AS total_donation
FROM Donation_Data Donation_Data
JOIN Donor_Data Donor_Data ON Donation_Data.id = Donor_Data.id
WHERE Donation_Data.donation >= 200
GROUP BY Donor_Data.movie_genre
ORDER BY total_donation DESC;
```

16. Does speaking a second language correlate with higher or more frequent donations?

- **Why it matters:** This reveals if localized, multilingual, or international-focused education campaigns will yield higher engagement.
- **SQL Concept:**

16. Does speaking a second language correlate with higher or more frequent donations?

```
SELECT Donor_Data.second_language, AVG(Donation_Data.donation)
AS avg_donation,
COUNT(Donation_Data.id) AS total_donors
FROM Donation_Data
JOIN Donor_Data ON Donation_Data.id = Donor_Data.id
GROUP BY Donor_Data.second_language
ORDER BY avg_donation DESC;
```

Pillar 4: Operational & Data Health Tracking

To expand database volume safely, you need to ensure data health and track geographic opportunities.

17. Are there specific high-performing states where we have very low donor volume?

- **Why it matters:** A state might have a high average donation but a low total donor count. This means it is an untapped market ripe for targeted digital ad expansion to acquire *new* donors.
-
- **SQL Concept:**

17. Are there specific high-performing states where we have very low donor volume?

```
SELECT state, AVG(donation) AS avg_donation,  
COUNT(id) AS total_donors  
FROM Donation_Data  
GROUP BY state  
HAVING COUNT(id) < 15 -- Adjust threshold based on your actual data footprint  
ORDER BY avg_donation DESC;
```
